

# Fundamental Algorithms

## Chapter 7: Parallel Sorting

Jan Křetínský

Winter 2017/18

# Sequential MergeSort

```
MergeSort(A: Array[1..n]) {  
  if n > 1 then {  
    m := floor(n/2);  
    create array L[1..m];  
    for i from 1 to m do { L[i] := A[i]; }  
  
    create array R[1..n-m];  
    for i from 1 to n-m do { R[i] := A[m+i]; }  
  
    MergeSort(L);  
    MergeSort(R);  
  
    Merge(L,R,A);  
  }  
}
```

(How) can we parallelise MergeSort?

## MergeSort in Parallel?

```

MergeSortPar(A: Array[1..n]) {
  if n > 1 then {
    m := floor(n/2);

    do in parallel {
      create array L[1...m];
      for i from 1 to m do { L[i] := A[i]; }
      MergeSort(L); // even better: MergeSortPar(L)
    }
    |
    create array R[1...n-m];
    for i from 1 to n-m do { R[i] := A[m+i]; }
    MergeSort(R); // even better: MergeSortPar(R)
  };

  Merge(L,R,A); // desired: MergePRAM(L,R,A)
}
}

```

# Parallel MergeSort

## Idea:

- parallelise “divide-and-conquer”:  
recursive calls can be done in parallel
- use  $p/2$  processors for each of the recursive calls  
(if  $p$  processors are available)

# Parallel MergeSort

## Idea:

- parallelise “divide-and-conquer”:  
recursive calls can be done in parallel
- use  $p/2$  processors for each of the recursive calls  
(if  $p$  processors are available)

## Merging in Parallel?

- can Merge be executed in parallel?
- by how many processors?

## Can Merge be Parallelised?

```
Merge (L:Array[1..p], R:Array[1..q], A:Array[1..n]) {  
  // merge the sorted arrays L and R into A (sorted)  
  // we presume that n=p+q  
  i:=1; j:=1:  
  for k from 1 to n do {  
    if i > p  
      then { A[k]:=R[j]; j=j+1; }  
    else if j > q  
      then { A[k]:=L[i]; i:=i+1; }  
    else if L[i] < R[j]  
      then { A[k]:=L[i]; i:=i+1; }  
      else { A[k]:=R[j]; j:=j+1; }  
    }  
  }  
}
```

## Can Merge be Parallelised?

```
Merge (L:Array[1..p], R:Array[1..q], A:Array[1..n]) {  
  // merge the sorted arrays L and R into A (sorted)  
  // we presume that n=p+q  
  i:=1; j:=1;  
  for k from 1 to n do {  
    if i > p  
      then { A[k]:=R[j]; j=j+1; }  
    else if j > q  
      then { A[k]:=L[i]; i:=i+1; }  
    else if L[i] < R[j]  
      then { A[k]:=L[i]; i:=i+1; }  
      else { A[k]:=R[j]; j:=j+1; }  
    }  
  }  
}
```

**Problem:** inherently sequential progress through arrays A, L, R

# Odd-Even Merge

## Ideas:

- start with a two sorted lists of length  $n/2$ :

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

# Odd-Even Merge

## Ideas:

- start with a two sorted lists of length  $n/2$ :

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- consider elements with **odd** and **even** index:

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

# Odd-Even Merge

## Ideas:

- start with a two sorted lists of length  $n/2$ :

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- consider elements with **odd** and **even** index:

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- sort **odd**- and **even**-indexed elements separately:

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

# Odd-Even Merge

## Ideas:

- start with a two sorted lists of length  $n/2$ :

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- consider elements with **odd** and **even** index:

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- sort **odd**- and **even**-indexed elements separately:

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

# Odd-Even Merge

## Ideas:

- start with a two sorted lists of length  $n/2$ :

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- consider elements with **odd** and **even** index:

2	3	4	7	1	5	6	8
---	---	---	---	---	---	---	---

- sort **odd**- and **even**-indexed elements separately:

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

## Observations

- final sequence is nearly sorted (only pairwise exchange required)
- odd- and even-indexed elements can be processed in parallel

# Correctness of the Final Exchange Step

## Claim (after odd/even sort):

- exchanges of  $a_{2i}$  and  $a_{2i+1}$  are sufficient for sorting

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

## Proof:

- let  $O$  and  $E$  be sorted odd and even sequence, respectively; let  $A$  be sorted sequence
- add  $E_0 = -\infty$  and  $O_{n/2+1} = \infty$ .
- for  $i \in 0, \dots, n/2$

$$A_{2i} = \min\{E_i, O_{i+1}\}$$

$$A_{2i+1} = \max\{E_i, O_{i+1}\}$$

note that  $A$  contains elements  $A_0 = -\infty$  and  $A_{n+1} = \infty$ .

## Correctness of the Final Exchange Step

- $i = 0$  the first two elements in  $A$  are clearly  $A_0 = -\infty$  and  $A_1 = O_1$ ;
- $i \geq 1$  using the induction hypothesis for  $i' = 0, \dots, i - 1$  gives that the positions  $A_0, \dots, A_{2i-1}$  are composed from  $i$  even and  $i$  odd elements; hence, the next element is

$$A_{2i} = \min\{E_i, O_{i+1}\}$$

(note that  $E$  is indexed starting from 0 and  $O$  starting from 1)

now, we either have more odd or more even elements; however the number of even/odd elements within a prefix of  $A$  can at most differ by 1; therefore if the last element was odd we now have to choose the smallest even element (and vice versa); this gives

$$A_{2i+1} = \max\{E_i, O_{i+1}\}$$

# Correctness of the Final Exchange Step

## Claim (after odd/even sort):

- exchanges of  $a_{2i}$  and  $a_{2i+1}$  are sufficient for sorting

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

# Correctness of the Final Exchange Step

## Claim (after odd/even sort):

- exchanges of  $a_{2i}$  and  $a_{2i+1}$  are sufficient for sorting

1	3	2	5	4	7	6	8
---	---	---	---	---	---	---	---

## Counting Argument: $x$ an odd-indexed element: $x = a_{2i+1}$

- exactly  $i$  odd-indexed elements are smaller than  $x$  (sorted lists)
- $d_l, d_r$  = number of odd-indexed elements  $< x$  in left/right half  
 $\Rightarrow i = d_l + d_r$
- $v_l, v_r$  = number of even-indexed elements  $< x$  in left/right half
- $x$  in left half:  $v_l = d_l, v_r \in \{d_r, d_r - 1\}$
- $x$  in right half:  $v_l \in \{d_l, d_l - 1\}, v_r = d_r$
- consequence:**  $v_l + v_r \in \{d_l + d_r, d_l + d_r - 1\} = \{i, i - 1\}$

## Correctness of the Final Exchange Step (2)

### Counting Argument:

- count even- and odd-indexed elements  $< x$  in both halves
- $v_l + v_r \in \{d_l + d_r, d_l + d_r - 1\} = \{i, i - 1\}$

### Possible Scenarios:

- $v_l + v_r = i \Rightarrow$  exactly  $i$  even elements  $< x$   
 $\Rightarrow i$ -th even-indexed element  $a_{2i} < x \rightarrow$  **OK**
- $v_l + v_r = i - 1 \Rightarrow$  exactly  $i - 1$  even elements  $< x$   
 therefore:  $a_{2(i-1)} < x$ , but  $a_{2i} > x \rightarrow$  **exchange**
- in both cases:  
 $a_{2(i+1)} > x$  (at most  $i$  even elements  $< x$ )  $\rightarrow$  **OK**  
 $a_{2(i-1)} < x$  (at least  $i - 1$  even elements  $< x$ )  $\rightarrow$  **OK**

$\Rightarrow$  **only the left even-indexed neighbour of  $x$  can be out of place**

## OddEvenMerge – A First Try

```
OddEvenMerge_1 (A: Array [1..n]) {  
  // merge the sorted arrays A[1..n/2] and A[n/2+1..n]  
  // into A (sorted); n is a power of 2  
  
  OddEvenSplit (A, Odd, Even);  
  
  Sort (Odd); Sort (Even);  
  
  OddEvenJoin (A, Odd, Even);  
  
  for i from 1 to n/2-1 do {  
    if A[2i] > A[2i+1]  
    then exchange A[2i] and A[2i+1]  
  }  
}
```

## OddEvenSplit and OddEvenJoin (in parallel!)

```
OddEvenSplit (A: Array[1..n],  
              Odd: Array[1..n/2], Even: Array[1..n/2]) {  
  for i from 1 to n/2 do in parallel {  
    Odd[i] := A[2i-1];  
    Even[i] := A[2i];  
  }  
}
```

```
OddEvenJoin (A: Array[1..n],  
            Odd: Array[1..n/2], Even: Array[1..n/2]) {  
  for i from 1 to n/2 do in parallel {  
    A[2i-1] := Odd[i] ;  
    A[2i] := Even[i];  
  }  
}
```

# Towards a Better Implementation of OddEvenMerge

## After OddEvenSplit:

- Odd consists of two halves that are already sorted
  - Even consists of two halves that are already sorted
- ⇒ Odd and Even can be sorted using OddEvenMerge

# Towards a Better Implementation of OddEvenMerge

## After OddEvenSplit:

- Odd consists of two halves that are already sorted
  - Even consists of two halves that are already sorted
- ⇒ Odd and Even can be sorted using OddEvenMerge

## OddEvenMerge in Parallel:

- OddEvenSplit and OddEvenJoin are already parallel
- calls to OddEvenMerge can be executed in parallel (recursive calls will again issue parallel calls)
- final exchange loop can be parallelised

## Parallel OddEvenMerge

```
OddEvenMergePRAM (A: Array [1..n]) {  
    ! add stopping criterion:  
    if n<=2 then { SortTwo(A); return; };  
  
    OddEvenSplit (A, Odd, Even);  
  
    do in parallel { OddEvenMergePRAM(Odd);  
                    OddEvenMergePRAM(Even); }  
  
    OddEvenJoin (A, Odd, Even);  
  
    for i from 1 to n/2-1 do in parallel {  
        if A[2i] > A[2i+1]  
        then exchange A[2i] and A[2i+1]  
    }  
}
```

# Parallelism in OddEvenMerge

2	3	7	8	1	4	5	6
---	---	---	---	---	---	---	---

# OddEvenMergeSort (in Parallel)

```
OddEvenMergeSortPRAM(A: Array[1..n]) {  
  ! EREW PRAM with n/2 processors  
  ! n assumed to be 2^k  
  if n >= 2 then {  
  
    do in parallel {  
      OddEvenMergeSortPRAM(A[1..n/2]);  
      |  
      OddEvenMergeSortPRAM(A[n/2+1..n]);  
    };  
  
    OddEvenMergePRAM(A);  
  }  
}
```

# Complexity of Odd-Even MergeSort

## Complexity of OddEvenMerge:

- $\Theta(\log n)$  subsequent steps
- each step executed on  $\frac{n}{2}$  processors
- total work:  $\Theta(n \log n)$

## Complexity of Odd-Even MergeSort:

- requires executions of OddEvenMerge on subarrays of lengths  $k = 2, 4, \dots, n$
- each OddEvenMerge step requires  $\Theta(\log k)$  steps
- number of subsequent steps:

$$\log 2 + \log 4 + \dots + \log n = \Theta((\log n)^2)$$

- total work:  $\Theta(n(\log n)^2)$
